

IQ AVL

Automatic Vehicle Location Software

By providing current location of all vehicles in your fleet via GPS technology, IQ AVL delivers the tools to keep your drivers safe and make your dispatchers more efficient.

Dispatch center personnel can direct the nearest drivers to the intended location without the need for voice communication. This is accomplished by a full-featured map interface that, at a glance, shows vehicle location, identification, and status.

RadioMobile's high capacity AVL system is capable of up to 14,000 transactions per

hour per site on conventional networks. The system can manage several sites at once bringing the update rate to 10's of messages per second to the mapping engine. IQ AVL can also be utilized on public and broadband systems.

IQ AVL can also be used in conjunction with other affordable RadioMobile products such as IQ Mobile, IQ CAD 911, and the MCT-8000 to provide a complete mobile data management solution.
